Concerned about the size of your power bill? Here are **eight reasons** why you should consider **Senztek Smart Controller!**

1. Designed & manufactured in New Zealand.

2. Only heat water when you need it, not 24/7.

3. Control the hot water yourself with a touch screen display.

4. Choose when to heat and make significant savings with off-peak rates.

5. Turn on Holiday Mode to keep your water safe and maximise savings while you're away.

6. Sterilisation Mode purifies and sterilises the cylinder to ensure your water is free of harmful bacteria.

7. Use the hot water fuel gauge to keep track of how much is immediately available to you.

8. Take maximum advantage of the one hour of free power that some retailers offer their customers.

The Verdict?

You might expect heavy users of hot water, such as our working family, to get the most benefit from the [Senztek]. But it may be homes with lower hot water demand that reap the biggest benefits, as they're the ones most likely to be keeping needlessly high volumes of hot water in reserve. Regardless, households on a time-of-use electricity tariff will enjoy better returns than those on a flat rate.

We think the main thing the [Senztek] lacks is the option to "learn" your hot water usage and adjust your settings accordingly, though this wouldn't have allowed us to trick the controller into heating water only at night for our retired couple who use Flick Electric Co. Most tech-savvy users will have little issue working out optimum settings for the controller within a week or two.
